CHAPTER 1 ABOUT THIS MANUAL

The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4: Model-Specific Registers (order number 335592) is part of a set that describes the architecture and programming environment of Intel® 64 and IA-32 architecture processors. Other volumes in this set are:

- Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture (order number 253665).
- Intel[®] 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C, & 2D: Instruction Set Reference (order numbers 253666, 253667, 326018, and 334569).
- The Intel[®] 64 and IA-32 Architectures Software Developer's Manual, Volumes 3A, 3B, 3C, & 3D: System Programming Guide (order numbers 253668, 253669, 326019, and 332831).

The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, describes the basic architecture and programming environment of Intel 64 and IA-32 processors. The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C, & 2D, describe the instruction set of the processor and the opcode structure. These volumes apply to application programmers and to programmers who write operating systems or executives. The Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 3A, 3B, 3C, & 3D, describe the operating-system support environment of Intel 64 and IA-32 processors. These volumes target operating-system and BIOS designers. In addition, the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B, and the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C, address the programming environment for classes of software that host operating systems. The Intel® 64 and IA-32 procestors.

1.1 OVERVIEW OF THE MODEL-SPECIFIC REGISTERS

A description of this manual's content follows:

Chapter 1 — About This Manual. Gives an overview of all volumes of the Intel[®] 64 and IA-32 Architectures Software Developer's Manual, with chapter-specific details for the current volume.

Chapter 2 — Model-Specific Registers (MSRs). Lists the MSRs available in Intel processors, and describes their functions.

CHAPTER 2 MODEL-SPECIFIC REGISTERS (MSRS)

This chapter lists MSRs across Intel processor families. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions. The scope of an MSR defines the set of processors that access the same MSR with RDMSR and WRMSR. Thread-scope MSRs are unique to every logical processor. Core-scope MSRs are shared by the threads in the same core; similarly for module-scope, die-scope, and package-scope.

When a processor package contains a single die, die-scope and package-scope are synonymous. When a package contains multiple die, they are distinct.

NOTE

For information on hierarchical level types supported, refer to the CPUID.1FH definition for the actual level type numbers: "V2 Extended Topology Enumeration Leaf" in the Intel $^{\otimes}$ 64 and IA-32 Architectures Software Developer's Manual, Volume 2A. Also see Section 10.9.1, "Hierarchical Mapping of Shared Resources," in the Intel $^{\otimes}$ 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L," in the Intel[®] 64 and IA-32 Architectures Software Developer's Manual, Volume 2A). Table 2-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these "architectural MSRs" were given the prefix "IA32_". Table 2-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table 2-2 and certain bit fields in an MSR address that may overlap with architectural MSR addresses are model-specific. Code that accesses a model-specific MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table 2-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of "DF_DM" (see Table 2-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYADDR" in Table 2-2. MAXPHYADDR is derived from the value enumerated in CPUID.80000008H:EAX[7:0] (this width is at most 52). However, if IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3); the value is not reduced in SEAM.¹

MSR address range between 40000000H - 4000FFFFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

NOTES:

- 1. Some older processors may have supported this MSR as model-specific and do not enumerate it with CPUID.
- 2. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
- 3. The *_ADDR MSRs may or may not be present; this depends on flag settings in IA32_MC*i_*STATUS. See Section 17.3.2.3 and Section 17.3.2.4 for more information.
- 4. Further details on Key Locker and usage of this MSR can be found here:

https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html.

2.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table 2-3 lists model-specific registers (MSRs) for the Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR addresses are also included in Table 2-3. These processors have a CPUID Signature DisplayFamily DisplayModel value of 06 OFH, see Table 2-1.

MSRs listed in Table 2-2 and Table 2-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_17H.

The column "Shared/Unique" applies to multi-core processors based on Intel Core microarchitecture. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

12	Processor Event Based Sampling Unavailable (R/O)	Shared
	See Table 2-2.	
13	TM2 Enable (R/W)	Shared
	When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.	
	When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state.	
	The BIOS must enable this feature if the TM2 feature flag (CPUID.01H:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location.	
	The processor is operating out of specification if both this bit and the TM1 bit are set to 0.

	When set to 1, the processor fetches the cache line that contains data currently required by the processor. When set to 0, the processor fetches cache lines that comprise a cache line pair (128 bytes).	
	Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing.	
	BIOS may contain a setup option that controls the setting of this bit.	
20	Enhanced Intel SpeedStep Technology Select Lock (R/WO)	Shared
	When set, this bit causes the following bits to become read-only:

	When set to a 0 (default), the Execute Disable Bit feature (if available) allows the OS to enable PAE paging and take advantage of data only pages.	
	BIOS must not alter the contents of this bit location if XD bit is not supported. Writing this bit to 1 when the XD Bit extended feature flag is set to 0 may generate a #GP exception.

37	DCU Prefetcher Disable (R/W)	Unique
	When set to 1, the DCU L1 data cache prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature.	
	The DCU prefetcher is an L1 data cache prefetcher. When the DCU prefetcher detects multiple loads from the same line done within a time limit, the DCU prefetcher assumes the next line will be required. The next line is prefetched in to the L1 data cache from memory or L2.	
38	IDA Disable (R/W)	Shared
	When set to 1 on processors that support IDA, the Intel Dynamic Acceleration feature (IDA) is disabled and the IDA_Enable feature flag will be cleared (CPUID.06H:EAX[1] =0).	
	When set to a 0 on processors that support IDA, CPUID.06H:EAX[1] reports the processor's support of IDA is enabled.	
	Note: The power-on default value is used by BIOS to detect hardware support of IDA. If the power-on default value is 1, IDA is available in the processor. If the power-on default value is 0, IDA is not available.	
39	IP Prefetcher Disable (R/W)	Unique
	When set to 1, the IP prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature.	
	The IP prefetcher is an L1 data cache prefetcher. The IP prefetcher looks for sequential load history to determine whether to prefetch the next expected data into the L1 cache from memory or L2.

2.3 MSRS IN THE 45 NM AND 32 NM INTEL ATOM® PROCESSOR FAMILY

Table 2-4 lists model-specific registers (MSRs) for 45 nm and 32 nm Intel Atom processors, architectural MSR addresses are also included in Table 2-4. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06 1CH, 06 26H, 06 27H, 06 35H, or 06 36H; see Table 2-1.

The column "Shared/Unique" applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. "Unique" means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. "Shared" means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is cleared (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.01H:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.	Shared

2.4 MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE

Table 2-6 lists model-specific registers (MSRs) common to Intel processors based on the Silvermont microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_37H, 06_4AH, 06_4DH, 06_5AH, or 06_5DH; see Table 2-1. The MSRs listed in Table 2-6 are also common to processors based on the Airmont microarchitecture and newer microarchitectures for next generation Intel Atom processors.

Table 2-7 lists MSRs common to processors based on the Silvermont and Airmont microarchitectures, but not newer microarchitectures.

Table 2-8, Table 2-9, and Table 2-10 lists MSRs that are model-specific across processors based on the Silvermont microarchitecture.

In the Silvermont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Silvermont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

2.5 MSRS IN INTEL ATOM® PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support MSRs listed in Table 2-6 and Table 2-12. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_5CH; see Table 2-1.

In the Goldmont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Goldmont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

0	PROCHOT Status (R0)	
	When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0)	
	When set, frequency is reduced below the operating system request due to a thermal event.	
2	Package-Level Power Limiting PL1 Status (R0)	
	When set, frequency is reduced below the operating system request due to package-level power limiting PL1.	
3	Package-Level PL2 Power Limiting Status (R0)	
	When set, frequency is reduced below the operating system request due to package-level power limiting PL2.	
8:4	Reserved.	
9	Core Power Limiting Status (R0)	
	When set, frequency is reduced below the operating system request due to domain-level power limiting.	
10	VR Therm Alert Status (R0)	
	When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
11	Max Turbo Limit Status (R0)	
	When set, frequency is reduced below the operating system request due to multi-core turbo limits.	
12	Electrical Design Point Status (R0)	
	When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
13	Turbo Transition Attenuation Status (R0)	
	When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
14	Maximum Efficiency Frequency Status (R0)	
	When set, frequency is reduced below the maximum efficiency frequency.	
15	Reserved.

2.6 MSRS IN INTEL ATOM® PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support MSRs listed in Table 2-6, Table 2-12, and Table 2-13. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_7AH; see Table 2-1. For an MSR listed in Table 2-13 that also appears in the model-specific tables of prior generations, Table 2-13 supersedes prior generation tables.

In the Goldmont Plus microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Goldmont Plus microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

2.7 MSRS IN INTEL ATOM® PROCESSORS BASED ON TREMONT MICROARCHITECTURE

Processors based on the Tremont microarchitecture support MSRs listed in Table 2-6, Table 2-12, Table 2-13, and Table 2-14. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_86H, 06_96H, or 06_9CH; see Table 2-1. For an MSR listed in Table 2-14 that also appears in the model-specific tables of prior generations, Table 2-14 supersedes prior generation tables.

In the Tremont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Tremont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

2.8 MSRS IN PROCESSORS BASED ON NEHALEM MICROARCHITECTURE

Table 2-15 lists model-specific registers (MSRs) that are common for Nehalem microarchitecture. These include the Intel Core i7 and i5 processor family. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, 06_1FH, or 06_2EH; see Table 2-1. Additional MSRs specific to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, or 06_1FH are listed in Table 2-16. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at http://biosbits.org.

The column "Scope" represents the package/core/thread scope of individual bit field of an MSR. "Thread" means this bit field must be programmed on each logical processor independently. "Core" means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. "Package" means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

2.11.2 MSRs in the Intel® Xeon® Processor E5 Family Based on Sandy Bridge Microarchitecture

Table 2-23 lists additional model-specific registers (MSRs) that are specific to the Intel[®] Xeon[®] Processor E5 Family based on Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH, and also support MSRs listed in Table 2-20 and Table 2-24.

2.11.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family

Intel Xeon Processor E5 family is based on the Sandy Bridge microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-24. For complete details of the uncore PMU, refer to the Intel Xeon Processor E5 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH.

2.12 MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY BASED ON IVY BRIDGE MICROARCHITECTURE

The 3rd generation $Intel^{\$}$ $Core^{\intercal M}$ processor family and the $Intel^{\$}$ $Xeon^{\$}$ processor E3-1200v2 product family based on Ivy Bridge microarchitecture support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, and Table 2-25. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.

2.12.1 MSRs in the Intel® Xeon® Processor E5 v2 Product Family Based on Ivy Bridge-E Microarchitecture

Table 2-26 lists model-specific registers (MSRs) that are specific to the Intel[®] Xeon[®] Processor E5 v2 Product Family (based on Ivy Bridge-E microarchitecture). These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3EH; see Table 2-1. These processors supports the MSR interfaces listed in Table 2-20 and Table 2-26.

22:16	Reserved.	
23	PPIN_CAP (R/O)	Package
	When set to 1, indicates that Protected Processor Inventory Number (PPIN) capability can be enabled for a privileged system inventory agent to read PPIN from MSR_PPIN.	
	When set to 0, PPIN capability is not supported. An attempt to access MSR_PPIN_CTL or MSR_PPIN will cause #GP.	
27:24	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O)	Package
	When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	
29	Programmable TDP Limit for Turbo Mode (R/O)	Package
	When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	
30	Programmable TJ OFFSET (R/O)	Package
	When set to 1, indicates that MSR_TEMPERATURE_TARGET.[27:24] is valid and writable to specify a temperature offset.	
39:31	Reserved.	
17:40	Maximum Efficiency Ratio (R/O)	Package

NOTES:

2.12.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families

Intel Xeon Processor E5 v2 and E7 v2 families are based on the Ivy Bridge-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-24 and Table 2-28. For complete detail of the uncore PMU, refer to Intel

^{1.} An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.13 MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS BASED ON HASWELL MICROARCHITECTURE

The 4th generation Intel[®] Core[™] processor family and the Intel[®] Xeon[®] processor E3-1200v3 product family (based on Haswell microarchitecture), with a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH, 06_45H, or 06_46H, support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, and Table 2-29. For an MSR listed in Table 2-20 that also appears in Table 2-29, Table 2-29 supersedes Table 2-20.

The MSRs listed in Table 2-29 also apply to processors based on Haswell-E microarchitecture (see Section 2.14).

NOTES:

2.14.1 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family

The Intel Xeon Processor E5 v3 and E7 v3 families are based on Haswell-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-33. For complete details of the uncore PMU, refer to the Intel Xeon Processor E5 v3 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3FH.

2.15 MSRS IN THE INTEL® CORE™ M PROCESSORS AND THE 5TH GENERATION INTEL® CORE™ PROCESSORS

The Intel[®] Core[™] M-5xxx processors, 5th generation Intel[®] Core[™] Processors, and the Intel[®] Xeon[®] Processor E3-1200 v4 family are based on Broadwell microarchitecture. The Intel[®] Core[™] M-5xxx processors and 5th generation Intel[®] Core[™] Processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH. The Intel[®] Xeon[®] Processor E3-1200 v4 family and 5th generation Intel[®] Core[™] Processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_47H. Processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH or 06_47H support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, Table 2-25, Table 2-29, Table 2-34, and Table 2-35. For an MSR listed in Table 2-35 that also appears in the model-specific tables of prior generations, Table 2-35 supersedes prior generation tables.

Table 2-34 lists MSRs that are common to processors based on the Broadwell microarchitectures (including CPUID Signature DisplayFamily_DisplayModel values of 06_3DH, 06_47H, 06_4FH, and 06_56H).

2.16 MSRS IN THE INTEL® XEON® PROCESSOR E5 V4 FAMILY

The MSRs listed in Table 2-36 are available and common to the $Intel^{\circledR}$ Xeon $^{\circledR}$ Processor D Product Family (CPUID Signature DisplayFamily_DisplayModel value of 06_56H) and to the Intel Xeon processors E5 v4 and E7 v4 families (CPUID Signature DisplayFamily_DisplayModel value of 06_4FH). These processors are based on Broadwell microarchitecture.

See Section 2.16.1 for lists of tables of MSRs that are supported by the Intel[®] Xeon[®] Processor D Family.

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.16.2 Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families

The MSRs listed in Table 2-37 are available to the Intel[®] Xeon[®] Processor E5 v4 and E7 v4 Families (CPUID Signature DisplayFamily_DisplayModel value of 06_4FH). The Intel[®] Xeon[®] processor E5 v4 family is based on Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-29, Table 2-34, Table 2-36, and Table 2-38.

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.17 MSRS IN THE 6TH—13TH GENERATION INTEL® CORE™ PROCESSORS, 1ST—5TH GENERATION INTEL® XEON® SCALABLE PROCESSOR FAMILIES, INTEL® CORE™ ULTRA 7 PROCESSORS, 8TH GENERATION INTEL® CORE™ I3 PROCESSORS, INTEL® XEON® E PROCESSORS, INTEL® XEON® 6 P-CORE PROCESSORS, INTEL® XEON® 6 E-CORE PROCESSORS, AND INTEL® SERIES 2 CORE™ ULTRA PROCESSORS

6th generation Intel $^{\$}$ Core $^{\intercal}$ processors are based on Skylake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_4EH or 06_5EH.

The Intel[®] Xeon[®] Scalable Processor Family based on the Skylake microarchitecture, the 2nd generation Intel[®] Xeon[®] Scalable Processor Family based on the Cascade Lake product, and the 3rd generation Intel[®] Xeon[®] Scalable Processor Family based on the Cooper Lake product all have a CPUID Signature DisplayFamily_DisplayModel value of 06_55H .

7th generation Intel[®] Core[™] processors are based on the Kaby Lake microarchitecture, 8th generation and 9th generation Intel[®] Core[™] processors, and Intel[®] Xeon[®] E processors are based on Coffee Lake microarchitecture; these processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_8EH or 06_9EH.

8th generation Intel® Core™ i3 processors are based on Cannon Lake microarchitecture and have a CPUID Signature DisplayFamily DisplayModel value of 06 66H.

10th generation Intel[®] Core[™] processors are based on Comet Lake microarchitecture (with a CPUID Signature DisplayFamily_DisplayModel value of 06_A5H or 06_A6H) and Ice Lake microarchitecture (with a CPUID Signature DisplayFamily_DisplayModel value of 06_7EH).

11th generation Intel $^{\mathbb{R}}$ Core $^{\mathsf{TM}}$ processors are based on Tiger Lake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_8CH or 06_8DH.

The 3rd generation $Intel^{\$}$ Xeon $^{\$}$ Scalable Processor Family is based on Ice Lake microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_6AH or 06_6CH.

12th generation Intel[®] Core[™] processors supporting the Alder Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_97H or 06_9AH.

13th generation Intel[®] Core[™] processors supporting the Raptor Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_BAH, 06_B7H, or 06_BFH.

The 4th generation Intel[®] Xeon[®] Scalable Processor Family is based on Sapphire Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_8FH.

The 5th generation Intel[®] Xeon[®] Scalable Processor Family is based on Emerald Rapids microarchitecture and has a CPUID Signature DisplayFamily DisplayModel value of 06 CFH.

The Intel[®] Core[™] Ultra 7 processors supporting the Meteor Lake hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_AAH.

The Intel $^{\$}$ Xeon $^{\$}$ 6 P-core processor is based on the Granite Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_ADH or 06_AEH.

The Intel[®] Xeon[®] 6 E-core processor is based on the Sierra Forest microarchitecture and has a CPUID Signature DisplayFamily DisplayModel value of 06 AFH.

The Intel[®] Series 2 Core[™] Ultra processors supporting the Lunar Lake performance hybrid architecture have a CPUID Signature DisplayFamily DisplayModel value of 06 BDH.

These processors support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-25, Table 2-29, Table 2-35, and Table 2-39¹. For an MSR listed in Table 2-39 that also appears in the model-specific tables of prior generations, Table 2-39 supersedes prior generation tables.

Tables 2-40 through 2-60 list additional supported MSR interfaces introduced in specific processors; see each table for additional details.

The notation of "Platform" in the Scope column (with respect to MSR_PLATFORM_ENERGY_COUNTER and MSR_PLATFORM_POWER_LIMIT) is limited to the power-delivery domain and the specifics of the power delivery integration may vary by platform vendor's implementation.

63:21	Reserved.	
Register Address: 350H, 848	MSR_BR_DETECT_CTRL	
Branch Monitoring Global Control (R/W)		
0	EnMonitoring	
	Global enable for branch monitoring.	
1	EnExcept	
	Enable branch monitoring event signaling on threshold trip.	
	The branch monitoring event handler is signaled via the existing PMI signaling mechanism as programmed from the corresponding local APIC LVT entry.	
2	EnLBRFrz	
	Enable LBR freeze on threshold trip. This will cause the LBR frozen bit 58 to be set in IA32_PERF_GLOBAL_STATUS when a triggering condition occurs and this bit is enabled.	
3	DisableInGuest	
	When set to '1', branch monitoring, event triggering and LBR freeze actions are disabled when operating at VMX non-root operation.	
7:4	Reserved.	
17:8	WindowSize	
	Window size defined by WindowCntSel. Values 0 - 1023 are supported.	
	Once the Window counter reaches the WindowSize count both the Window Counter and all Branch Monitoring Counters are cleared.	
23:18	Reserved.	
25:24	WindowCntSel	
	Window event count select:	
	'00 = Instructions retired.	
	'01 = Branch instructions retired	
	'10 = Return instructions retired.	
	'11 = Indirect branch instructions retired.	
26	CntAndMode	
	When set to '1', the overall branch monitoring event triggering condition is true only if all enabled counters' threshold conditions are true.	
	When '0', the threshold tripping condition is true if any enabled counters' threshold is true.	
63:27	Reserved.	
Register Address: 351H, 849	MSR_BR_DETECT_STATUS	
Branch Monitoring Global Status (R/W)		
0	Branch Monitoring Event Signaled	
	When set to '1', Branch Monitoring event signaling is blocked until this bit is cleared by software.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
1	LBRsValid	
	This status bit is set to '1' if the LBR state is considered valid for sampling by branch monitoring software.	
7:2	Reserved.	
8	CntrHit0	
	Branch monitoring counter #0 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.	
9	CntrHit1	
	Branch monitoring counter #1 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.	
15:10	Reserved.	
	Reserved for additional branch monitoring counters threshold hit status.	
25:16	CountWindow	
	The current value of the window counter. The count value is frozen on a valid branch monitoring triggering condition. This is a 10-bit unsigned value.	
31:26	Reserved.	
	Reserved for future extension of CountWindow.	
39:32	Count0 The current value of counter 0 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit0 will also be set). This is an 8-bit signed value (2's complement).	
	Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256).	
	RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).	
47:40	Count1	
	The current value of counter 1 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit1 will also be set). This is an 8-bit signed value (2's complement).	
	Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256).	
	RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).

	'0000101 = Far branch instructions.	
14:8	CntrThreshold	
	Threshold (an unsigned value of 0 to 127 supported). The value 0 of counter threshold will result in event signaled after every instruction. #GP if threshold is < 2.	
15	MispredEventCnt	
	Mispredict events counting behavior:	
	'0 = Mispredict events are counted in a window.	
	'1 = Mispredict events are counted based on a consecutive occurrence. CntrThreshold is treated as # of consecutive mispredicts. This control bit only applies to events specified by CntrEvSel that involve a prediction (0000010, 0000011, 0000100). Setting this bit for other events is ignored.

63:0	Value since last reset for the Core C1 residency. Counter rate is the Max Non-Turbo frequency (same as TSC). This counter counts in case both of the core's threads are in an idle state and at least one of the core's thread residency is in a C1 state or in one of its sub states. The counter is updated only after a core C state exit. Note: Always reads 0 if core C1 is unsupported. A value of zero indicates that this processor does not support core C1 or never entered core C1 level state.

Register Information / Bit Fields	Bit Description	Scope
19:0	WAYS_MASK	
	Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.04H.02H:EBX[31:22] will indicate this).</n>	
	Writing a 1 to a value beyond the highest way or a non- contiguous set of 1s will cause a #GP on the WRMSR to this MSR.

2.17.8 MSRs Specific to the 4th and 5th Generation Intel® Xeon® Scalable Processor Families

The 4th generation Intel[®] Xeon[®] Scalable Processor Family based on Sapphire Rapids microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_8FH) and the 5th generation Intel[®] Xeon[®] Scalable Processor Family based on Emerald Rapids microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_CFH) both support the MSRs listed in Section 2.17, "MSRs In the 6th—13th Generation Intel® CoreTM Proces-

sors, 1st—5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 P-core processors, Intel® Xeon® 6 E-core processors, and Intel® Series 2 Core™ Ultra Processors," including Table 2-52. For an MSR listed in Table 2-52 that also appears in the model-specific tables of prior generations, Table 2-52 supersedes prior generation tables

Certain bit field positions may be related to the maximum physical address width, the value of which is expressed as "MAXPHYADDR" in Table 2-52. See Section 2.1 for an explanation of this value.

Platform Energy Status (R/O)		Package
31:0	TOTAL_ENERGY_CONSUMED	
	Total energy consumption in J (32.0), in 10nsec units.	
63:32	TIME_STAMP	
	Time stamp (U32.0).	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W-L)		Package
16:0	POWER_LIMIT_1	
	The average power limit value that the platform must not exceed over a time window as specified by the Power_Limit_1_TIME field.	
	The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPL_POWER_UNIT.	
17	POWER_LIMIT_1_EN	
	When set, the processor can apply control policies such that the platform average power does not exceed the Power_Limit_1 value over an exponential weighted moving average of the time window.	
18	CRITICAL_POWER_CLAMP_1	
	When set, the processor can go below the OS-requested P States to maintain the power below the specified Power_Limit_1 value.

Register Information / Bit Fields	Bit Description	Scope
25:19	POWER_LIMIT_1_TIME	
	This indicates the time window over which the Power_Limit_1 value should be maintained.	
	This field is made up of two numbers from the following equation:	
	Time Window = $(float) ((1+(X/4))*(2^Y))$, where:	
	X = POWER_LIMIT_1_TIME[23:22]	
	Y = POWER_LIMIT_1_TIME[21:17]	
	The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN].	
	The default value is ODH, and the unit is specified in MSR_RAPL_POWER_UNIT[Time Unit].	
31:26	Reserved.	
48:32	POWER_LIMIT_2	
	This is the Duration Power limit value that the platform must not exceed.	
	The unit is specified in MSR_RAPL_POWER_UNIT.	
49	Enable Platform Power Limit #2	
	When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #2 over the Short Duration time window.	
50	Platform Clamping Limitation #2	
	When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #2 value.	
57:51	POWER_LIMIT_2_TIME	
	This indicates the time window over which the Power_Limit_2 value should be maintained.	
	This field has the same format as the POWER_LIMIT_1_TIME field.	
62:58	Reserved.	
63	LOCK	
	Setting this bit will lock all other bits of this MSR until system RESET.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Соге
26:0	Reserved.	
27	UC_STORE_THROTTLE	
	If set to 1, when enabled, the processor will only allow one in- progress UC store at a time.	
28	UC_LOCK_DISABLE	
	If set to 1, a UC lock will cause a #GP(0) exception.	
	See Section 10.1.2.3, "Features to Disable Bus Locks."	
29	SPLIT_LOCK_DISABLE	
	If set to 1, a split lock will cause an #AC(0) exception.	
	See Section 10.1.2.3, "Features to Disable Bus Locks."	
63:30	Reserved.	
Register Address: 7AH, 122	IA32_FEATURE_ACTIVATION	
Feature Activation (R/W) Implements Feature Activation command. WRMS See Table 2-2.	SR to this address activates all 'activatable' features on this thread.	
Register Address: 80H, 128	MSR_TRACE_HUB_STH_ACPIBAR_BASE	
MSR_TRACE_HUB_STH_ACPIBAR_BASE (R/W)		Thread
This register is used by BIOS to program Trace I	Hub STH base address that will be used by AET messages.	
0	LOCK	
	Lock bit. If set, this MSR cannot be re-written anymore. The lock bit has to be set in order for the AET packets to be directed to Trace Hub MMIO.	
17:1	Reserved.	
4F:10	ADDRESS

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
3:0	PKG_C_STATE_LIMIT	
	Specifies the lowest processor-specific C-state code name (consuming the least power) for the package.	
	The default is set as factory-configured package C-state limit.	
	The following C-state code name encodings may be supported:	
	0000b: CO/C1 (no package C-state support)	
	0001b: C2	
	0010b: C3	
	0011b: C6	
	0100b: C7	
	0101b: C7s	
	0110b: C8	
	0111b: C9	
	1000b: C10	
7:4	MAX_CORE_C_STATE	
	Possible values are: 0000—reserved; 0001—C1; 0010—C3, 0011—C6.	
9:8	Reserved.	
10	IO_MWAIT_REDIRECTION_ENABLE	
	When set, will map IO_read instructions sent to IO registers PMG_IO_BASE_ADDR.PMBO+0/1/2 to MWAIT(C2,3,4) instructions; applies to deepc4 too.	
14:11	Reserved.	
15	CFG_LOCK	
	When set, locks bits 15:0 of this register for further writes, until the next reset occurs.	
24:16	Reserved.	
25	C3_STATE_AUTO_DEMOTION_ENABLE	
	When set, processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1_STATE_AUTO_DEMOTION_ENABLE	
	When set, processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	ENABLE_C3_UNDEMOTION	
	Enable Un-Demotion from Demoted C3.	
28	ENABLE_C1_UNDEMOTION	
	Enable Un-Demotion from Demoted C1.	
29	ENABLE_PKGC_AUTODEMOTION	
	Enable Package C-State Auto-Demotion. It enables use of the history of past package C-state depth and residence, as a factor in determining C-State depth.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
30	ENABLE_PKGC_UNDEMOTION	
	Enable Package C-State Un-Demotion. It enables considering cases where demotion was the incorrect decision in determining C-State depth.	
31	TIMED_MWAIT_ENABLE	
	When set, enables Timed MWAIT feature. MWAIT would #GP on attempts to do setup MWAIT timer if this bit is not set.	
63:32	Reserved.	
Register Address: E4H, 228	MSR_IO_CAPTURE_BASE	
IO Capture Base (R/W) Power Management IO Redirection in C-state. Se	ee http://biosbits.org.	Core
15:0	LVL_2_BASE_ADDRESS	
	Specifies the base address visible to software for IO redirection. If MSR_PKG_CST_CONFIG_CONTROL.IO_MWAIT_REDIRECTION_ENA BLE, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	CST_RANGE	
	Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL.IO_MWAIT_REDIRECTION_ENA BLE:	
	000b—C3 is the max C-State to include.	
	001b—C6 is the max C-State to include.	
	010b—C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Feature Configuration (R/W)		Соге
0	AESNI_LOCK	
	Once this bit is set, writes to this register will not be allowed.	
1	AESNI_DISABLE	
	This bit disables Advanced Encryption Standard feature on this processor core. To disable AES, BIOS will write '11 to this MSR on every core.	
63:2	Reserved.	
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Feature Enable (R/W)		Thread
Miscellaneous enables for thread specific feature	es.	
0	CPUID_GP_ON_CPL_GT_0 Causes CPUID to #GP if CPL greater than 0 and not in SMM.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target (R/W)	,	Package
Legacy register holding temperature related con	stants for Platform use.	
6:0	TCC Offset Time Window	
	Describes the RATL averaging time window.	
7	TCC Offset Clamping Bit	
	When enabled will allow RATL throttling below P1.	
15:8	Temperature Control Offset	
	Fan Temperature Target Offset (a.k.a. T-Control) indicates the relative offset from the Thermal Monitor Trip Temperature at which fans should be engaged.	
23:16	TCC Activation Temperature	
	The minimum temperature at which PROCHOT# will be asserted. The value is degrees C.	
30:24	TCC Activation Offset	
	Specifies a temperature offset in degrees C from the temperature target (bits 23:16). PROCHOT# will assert at the offset target temperature. Write is permitted only if MSR_PLATFORM_INFO[30] is set.	
31	LOCKED	
	When set, this entire register becomes read-only.	
63:2	Reserved.	
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
PREFETCH Control (R/W) Prefetch disable bits.		Thread
0	L2_HARDWARE_PREFETCHER_DISABLE	
	If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE	
	If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	
2	DCU_HARDWARE_PREFETCHER_DISABLE	
	If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE	
	If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	DCU_NEXT_PAGE_PREFETCH_DISABLE	
	If 1, disables Next Page prefetcher.	
5	AMP_PREFETCH_DISABLE	
	If 1, disables L2 Adaptive Multipath Probability (AMP) prefetcher.

2.17.10 MSRs Introduced in the Intel® Xeon® 6 P-Core Processors

Table 2-56 lists additional MSRs for the Intel Xeon 6 P-core processors. Intel Xeon 6 P-core processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_ADH or 06_AEH.

For an MSR listed in Table 2-56 that also appears in the model-specific tables of prior generations, Table 2-56 supersedes prior generation tables.

2.17.11 MSRs Introduced in the Intel® Xeon® 6 E-Core Processors

Table 2-57 lists additional MSRs for the Intel Xeon 6 E-core processors. Intel Xeon 6 E-core processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_AFH.

For an MSR listed in Table 2-57 that also appears in the model-specific tables of prior generations, Table 2-57 supersedes prior generation tables.

2.17.12 MSRs Introduced in the Intel® Series 2 Core™ Ultra Processor Supporting Performance Hybrid Architecture

Table 2-58 lists additional MSRs for the Intel Series 2 Core Ultra processor with a CPUID Signature DisplayFamily_DisplayModel value of 06_BDH. Table 2-59 lists the MSRs unique to the processor P-core. Table 2-60 lists the MSRs unique to the processor E-core.

For an MSR listed in Table 2-58, Table 2-59, or Table 2-60 that also appears in the model-specific tables of prior generations, Table 2-58, Table 2-59, and Table 2-60 supersede prior generation tables.

2.18 MSRS IN THE INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND THE INTEL® XEON PHI™ PROCESSOR 7215/7285/7295 SERIES

The Intel[®] Xeon Phi[™] processor 3200, 5200, 7200 series, with a CPUID Signature DisplayFamily_DisplayModel value of 06_57H, supports the MSR interfaces listed in Table 2-61. These processors are based on the Knights Landing microarchitecture. The Intel[®] Xeon Phi[™] processor 7215, 7285, 7295 series, with a CPUID Signature DisplayFamily_DisplayModel value of 06_85H, supports the MSR interfaces listed in Table 2-61 and Table 2-62. These processors are based on the Knights Mill microarchitecture. Some MSRs are shared between a pair of processor cores, and the scope is marked as module.

C-State Configuration Control (R/W)		Package
2:0	Package C-State Limit (R/W) Specifies the lowest C-state for the package. This feature does not limit the processor core C-state. The power-on default value from bit[2:0] of this register reports the deepest package C-state the processor is capable to support when manufactured. It is recommended that BIOS always read the power-on default value reported from this bit field to determine the supported deepest C-state on the processor and leave it as default without changing it. 000b - CO/C1 (No package C-state support) 001b - C2 010b - C6 (non retention)* 101b - Reserved 110b - Reserved 111b - No package C-state limit. All C-States supported by the processor are available. Note: C6 retention mode provides more power saving than C6 non-retention mode. Limiting the package to C6 non retention mode does prevent the MSR_PKG_C6_RESIDENCY counter (MSR 3F9h) from being incremented.	
9:3	Reserved.

2.19 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table 2-63 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table 2-1.

- MSRs with an "IA32_" prefix are designated as "architectural." This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an "MSR_" prefix are model specific with respect to address functionalities. The column "Model Availability" lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See "CPUID—CPU Identification" in Chapter 3 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A.

8	Suppress Lock Enable			
	When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.			
9	Prefetch Queue Disable			
	When set, disables the prefetch queue. When clear (default), enables the prefetch queue.			
10	FERR# Interrupt Reporting Enable (R/W)			
	When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled.			
	When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt.			
	This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.			
11	Branch Trace Storage Unavailable (BTS_UNAVILABLE) (R)			
	See Table 2-2.			
	When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.			
12	PEBS_UNAVILABLE: Processor Event Based Sampling Unavailable (R)			
	See Table 2-2.			
	When set, the processor does not support processor event-based sampling (PEBS); when clear, PEBS is supported.			
13	TM2 Enable (R/W)	3		
	When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.			
	When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state.			
	If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.

19	Adjacent Cache Line Prefetch Disable (R/W)		
	When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector.		
	Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing.		
	BIOS may contain a setup option that controls the setting of this bit.		
21:20	Reserved.		
22	Limit CPUID MAXVAL (R/W)	3, 4, 6	
	See Table 2-2.		
	Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.		
23	xTPR Message Disable (R/W)		Shared
	See Table 2-2.		
24	L1 Data Cache Context Mode (R/W)		
	When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 13.5.6, "L1 Data Cache Context Mode."		
	When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive.		
	If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].

NOTES			

MSRs Unique to Intel® Xeon® Processor MP with L3 Cache 2.19.1

The MSRs listed in Table 2-64 apply to Intel[®] Xeon[®] Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf, CPUID.04H, to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (see CPUID instruction for more details).

The MSRs listed in Table 2-65 apply to Intel[®] Xeon[®] Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter, CPUID.04H, to detect the presence of the third level cache, and

with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table 2-65 are shared between logical processors in the same core, but are replicated for each core.

2.20 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table 2-66. The column "Shared/Unique" applies to Intel Core Duo processor. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

12	Reserved.		
13	TM2 Enable (R/W)	Shared	
	When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.		
	When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state.		
	If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.

Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).	que	
Register Address: 415H, 1045 MSR_MC5_STATUS		
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.		
Register Address: 416H, 1046 MSR_MC5_ADDR		
Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDRV flag in the IA32_MCi_STATUS register is set.

2.22 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table 2-2 for a list of the architectural MSRs.

Defined in MCA architecture but not implemented in the P6 family processors.		

NOTES

- 1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
- 2. The processor number feature may be disabled by setting bit 21 of the BBL_CR_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL_CR_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
- 3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

2.23 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5_MC_ADDR, P5_MC_TYPE, and TSC MSRs (named IA32_P5_MC_ADDR, IA32_P5_MC_TYPE, and IA32_TIME_STAMP_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section 2.1, "Architectural MSRs"). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.
